GObject Placement 1.1

GM command quick reference | CoACore / AFK Realm | Worldforged placement workflow

Object positioning and rotation

Command	What it does
.gobject yaw <GUID> <degrees>	Turn left/right around the vertical axis.
.gobject pitch <GUID> <degrees>	Tilt forward/backward.
.gobject roll <GUID> <degrees>	Tilt sideways.
.gobject placement move <GUID>	Move to the GM character's position, retaining rotation.
.gobject placement move <GUID> <X> <Y> <Z>	Move to specified coordinates, retaining rotation.

Saving, status, and verification

Command	What it does
.gobject save <GUID>	Persist current placement to the database.
.gobject placement discard <GUID>	Restore the database placement; discard unsaved changes.
.gobject placement status <GUID>	Show coordinates, rotation, persistence, verification, history.
.gobject placement verify <GUID>	Mark a saved placement as manually verified.
.gobject placement unverify <GUID>	Remove verification.

Exports

Command	What it does
.gobject placement export worldforged	Export all Worldforged pickups from the database, including unloaded spawns.
.gobject placement export verified	Export verified corrections, originals, and history.
.gobject placement export sql	Generate guarded SQL updates for verified corrections.

Deployment note

This is a compiled CoACore module, not a plug-and-play launcher extension. The installation creates module tracking tables and command help rows. Removing the module and rebuilding removes its commands; database tracking records remain unless separately removed. Tested against CoACore revision 9fae1a46.

Rotation at a glance

Yaw turns, pitch nods, and roll leans. Angles set by these commands are absolute, not incremental.

Important behavior

• Rotation commands change the live object first; use **.gobject save** to persist the result.

• **.gobject placement discard** restores the saved database placement if changes are still unsaved.

• **Verify** is separate from **save**; use it only after confirming the corrected placement.

• The module captures the original placement and keeps a change history. Exports are timestamped text files under **Server\gobject_placement_exports**.

Example workflow and in-game results

Example: Bear Left Overs (GUID 6940950, entry 95681). The object was raised and reoriented to fit snowy terrain.

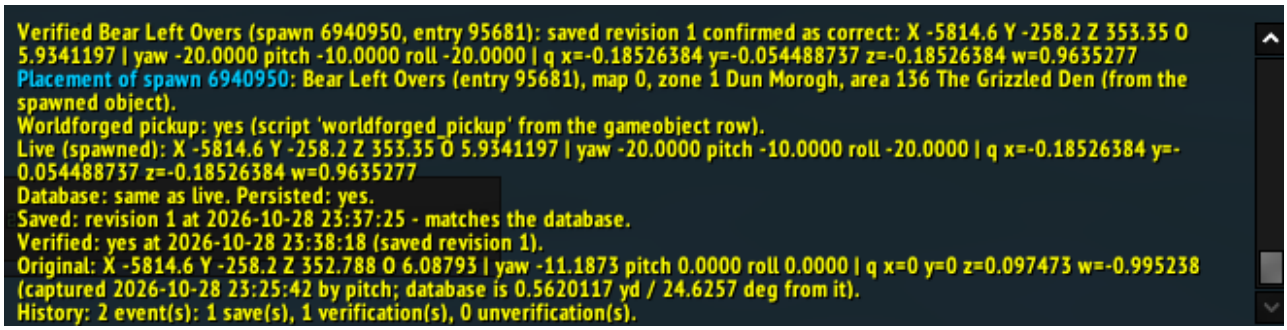

Typical correction sequence

```
.gobject near
.gobject placement status 6940950
.gobject yaw 6940950 -20
.gobject pitch 6940950 -10
.gobject roll 6940950 -20
.gobject save 6940950
.gobject placement verify 6940950
.gobject placement export verified
```

Live gameplay examples

In-game pickup and sparkle effects on the snowy hillside.

Saved revision 1, verified placement, and recorded history.

Verified export completed: one placement and two history records.
